Title:

Implementation and Analysis of DFS and BFS for an application

Problem Description:

A web crawler bot is like something to search the World Wide Web automatically for Web indexing. The problem here is to show how the DFS and BFS traverse through a simple web page.

Solution:

The idea is to start from source page and follow all links from source and keep doing same using DFS and BFS.

Python Code using BFS:

```
from time import time

graph = {

'Homepage': ['AboutAuthor', 'RecipesIndex'],

'AboutAuthor': ['Summary', 'Contact'],

'Summary': [],

'Contact': [],

'RecipesIndex': ['Veg'],

'Veg': ['BreakfastIndex', 'LunchIndex', 'DinnerIndex'],

'BreakfastIndex': ['Idli', 'Dosa'],

'LunchIndex': ['RiceVariety', 'sambar', 'Curd'],

'DinnerIndex': ['Chappathi', 'Naan', 'Phulka', 'AlooMutterMasala'],

'Idli': [],
```

```
'Dosa': [],
  'RiceVariety': [],
  'sambar': [],
  'Curd': [],
  'Chappathi': [],
  'Naan': [],
  'Phulka': [],
  'AlooMutterMasala': []
visited = [] # List to keep track of visited nodes.
queue = [] # Initialize a queue
def bfs(visited, graph, node):
  visited.append(node)
  queue.append(node)
  while queue:
     s = queue.pop(0)
     print(s, end="\n")
     for neighbour in graph[s]:
       if neighbour not in visited:
          visited.append(neighbour)
          queue.append(neighbour)
# Driver Code
t0 = time()
bfs(visited, graph, 'Homepage')
t1 = time() - t0
print('Time for BFS :', t1, 'seconds')
```

Output for BFS:

```
| PROBLEMS OUTPUT DEBUG CONSOLE | TERMINAL | DEBUG CONSOLE | TERMINAL | Debug Console | Terminal | Python + V | Debug Console | Terminal | Python + V | Debug Console | Python + V | Debug Con
```

Python Code using DFS:

```
from time import time
graph = {
  'Homepage': ['AboutAuthor', 'RecipesIndex'],
  'AboutAuthor': ['Summary', 'Contact'],
  'Summary': [],
  'Contact': [],
  'RecipesIndex': ['Veg'],
  'Veg': ['BreakfastIndex', 'LunchIndex', 'DinnerIndex'],
  'BreakfastIndex': ['Idli', 'Dosa'],
  'LunchIndex': ['RiceVariety', 'sambar', 'Curd'],
  'DinnerIndex': ['Chappathi', 'Naan', 'Phulka', 'AlooMutterMasala'],
  'ldli': [],
  'Dosa': [],
  'RiceVariety': [],
  'sambar': [],
  'Curd': [],
  'Chappathi': [],
  'Naan': [],
  'Phulka': [],
```

```
'AlooMutterMasala': []

visited = set() # Set to keep track of visited nodes.

def dfs(visited, graph, node):
    if node not in visited:
        print(node)
        visited.add(node)
        for neighbour in graph[node]:
            dfs(visited, graph, neighbour)

# Driver Code

t0 = time()

dfs(visited, graph, 'Homepage')

t1 = time() - t0

print('Time for DFS :', t1, 'seconds')
```

Output for DFS:

```
PROBLEMS OUTPUT DEBUG CONSOLE TERMINAL

/UST/local/bin/python3 "/Users/saimohitambekar/Documents/Sai Work/Class/AI Lab/EXP4 BFS and DFS/dfs.₽

py"

Analysis:

The time complexity for DFS and BFS on a graph is O(V + E); where V is the number of vertices and E is the number of edges. From the output, it is clear that time taken to traverse the nodes using **DFS (0.0019secs)** is better than **BFS (0.0026secs)**.
